

2022 Spotlight Survey

Wildlife Diversity Program Note #22-1

METHODS

The spotlight survey was initiated in 1981, and has been conducted annually since that time. Observers drive slowly (10–15 mph) on public roads, using 100,000-candlepower spotlights to detect animals by seeing their entire bodies or light reflected from their eyes. Sampling begins an hour after sunset. Most routes are 25 miles in length.

Sampling is phased in from Illinois' southernmost counties (21 March to 4 April) to the northernmost (11–25 April) to account for differences in phenology. Ideally, routes are sampled when relative humidity is $\geq 60\%$, air temperature is $>32^{\circ}\text{F}$, and rain or heavy fog is absent (Rybarczyk 1978).

RESULTS

During 2022, staff sampled 975 miles and observed 10,855 animals on 40 routes (Table 1). Animals observed in addition to target species included 43 coyotes, 11 red fox, 3 beaver, 7 bobcat, and 146 house cats. Staff also recorded 1 owl, 9 geese 2 mink and a muskrat; in some cases, species could not be determined.

The number of raccoons observed per mile on 40 routes sampled during 2022 was slightly more than in 2021 (Table 2). Indices varied from 0.76–7.40 raccoons per mile for individual routes (Table 3). Long-term indices (1981–2022) correlated

negatively with harvest levels during the preceding season ($r = -0.764$; $p < 0.01$).

DISCUSSION

Spotlight surveys are useful for monitoring relative abundance of the raccoon at large spatial and temporal scales (Bauder et al. 2021, Gehrt et al. 2002). In 2022, the statewide spotlight index was 4 times greater than when surveys started in 1981. The index for 2022 was 2.16.

Results allow IDNR to adjust harvest regulations for large changes in abundance of raccoons. Since 1990-91, seasons for trapping raccoon increased four times, adding a total of 30 days in the northern zone and 32 in the south. Hunting seasons increased from 62 days (north) or 55 days (south) to 93 days. Such changes are not likely to affect harvest levels during periods of low pelt values (Hubert 1990). However, liberal seasons maximize recreational opportunities for core participants and make the most of upswings in volatile markets.

Raccoons are an important part of Illinois' fur harvest. They also cause property damage (Bluett 2003), harbor zoonoses (Page et al. 2016), and affect other wildlife populations through diseases, parasites, and predation (Schmidt 2002, Heske et al. 1999, Mitchell et al. 1999). Spring spotlight surveys provide reliable information for management decisions, ecological research, and efforts to increase public support for wildlife conservation. Like Nielsen et al.

(2009), we recommend sampling ≥ 37 routes per year.
